EXPERIENCE

YieldStream

San Diego, CA

Founder & Software Engineer

Oct 2025 – Present

- Founded and independently built a production B2B SaaS platform for alternative-lending brokers, addressing underwriting inefficiencies observed firsthand in the industry.
- Architected a 3-layer scoring engine (global market signals, ISO-specific relationship history, attribute-level risk matching) producing auditable, ranked lender recommendations — each layer scored and persisted independently so weightings can be re-evaluated without recomputation.
- Built Stripe billing with webhook-driven lifecycle management, Inngest background processing with step-level retries, and PostgreSQL row-level security for multi-tenant isolation.
- Instrumented an outcome feedback loop: every funded/declined result is captured with merchant and prediction snapshots, feeding recency-weighted relationship scores and auto-expiring decline penalties.

Liquid Web Inc (GiveWP)

San Diego, CA / Remote

Software Engineer

Apr 2022 – Oct 2025

- Shipped two major product releases as part of a 6-person engineering team for a donation platform serving 100,000+ active installs, collaborating with product, design, QA, and support leadership across multiple repositories.
- Co-architected the 3.0 visual form builder (React 18, TypeScript), replacing the legacy PHP rendering system with a drag-and-drop interface. Built a two-tier state sync between builder and iframe preview, delivering real-time editing across 3 responsive breakpoints.
- Built admin views for donations, subscriptions, and donors — each with KPI dashboards, analytics charts, and editing forms. Established the component architecture that became the team's pattern for all subsequent admin pages.
- Led accessibility remediation across the platform (ARIA labels, keyboard focus management, semantic HTML, color contrast), bringing the product into WCAG compliance.
- Owned 4 third-party integration migrations (PHP, REST APIs) across the full install base, replacing manual API key configuration with an OAuth flow through a gateway server.

PROJECTS

Ledger — Document Intelligence API

github.com/YieldStream-ai/Ledger

- 5-stage document pipeline (Python, FastAPI) powering YieldStream's underwriting: 4-tier extraction cascade auto-escalating on confidence, 14 bank-specific parsers for structured extraction, and a Gemini AI enrichment layer for underwriting intelligence (revenue trends, MCA stacking, DSCR).
- Deployed serverlessly on AWS Lambda via Terraform (ECR, API Gateway, CloudWatch).

BubbleChat — Embeddable AI Chat Widget

github.com/JoshuaHungDinh/Bubble-Chat

- Zero-dependency embeddable widget (Web Components, Shadow DOM, 17KB) with real-time SSE streaming.
- Multi-tenant FastAPI backend with JWT auth and rate limiting, plus a React 19 admin dashboard with live preview.

SKILLS

Languages: TypeScript, JavaScript, Python, PHP, SQL

Frontend: React 18/19, Next.js 15, Tailwind CSS, Framer Motion, Web Components

Backend: Node.js, FastAPI, REST APIs, PostgreSQL, Supabase

Infrastructure: AWS (Lambda, API Gateway, ECR), Terraform, Docker, Vercel

Testing: pytest, PHPUnit, Postman
