EXPERIENCE

GiveWP - StellarWP / Liquid Web

Remote

Software Engineer

Apr 2022 - Oct 2025

- Core engineer on a ~6-person team that shipped two major product releases for a donation platform serving 100,000+ active installs. Collaborated directly with product managers, designers, QA, and customer service leadership to shape product direction across multiple repositories.
- Co-architected the 3.0 visual form builder (React 18, TypeScript) - a drag-and-drop interface that replaced the legacy system. Solved bidirectional state sync between builder and iframe preview, delivering real-time editing across 3 responsive breakpoints.
- Built admin views for donations, subscriptions, and donors - each with KPI dashboards, analytics charts, and entity-specific editing forms. Established the component architecture that became the team's pattern for all subsequent admin pages.
- Led accessibility remediation across the platform - ARIA labels, keyboard focus management, semantic HTML, and color contrast - bringing the product into WCAG compliance.
- Owned 4 third-party integration migrations across the full install base. Replaced manual API key configuration with an OAuth flow through a gateway server, and shipped a critical hotfix when Constant Contact deprecated their v2 API without notice - migrating all active integrations to v3 with zero downtime.

PROJECTS

YieldStream - B2B Underwriting Platform

github.com/YieldStream-ai/YieldStream

- Founded and independently built a full-stack B2B platform (Next.js 15, React 19, TypeScript, Python, PostgreSQL) for brokers in alternative lending, born from inefficiencies identified firsthand as a broker.
- Designed a 3-layer AI scoring model that replaced manual underwriting with deterministic, auditable lender recommendations.
- Built end-to-end product infrastructure: Stripe billing, multi-provider OAuth, background job orchestration with retry and failure handling, and a multi-tenant database architecture.

Ledger - Document Intelligence API

github.com/YieldStream-ai/Ledger

- OCR pipeline (Python, FastAPI) that turns unstructured bank statements into structured financial data. Built a 4-tier extraction cascade with a quality gate that auto-escalates from fast text parsing to OCR to cloud fallback based on confidence scoring.
- Developed a template engine with 14 bank-specific parsers that match documents by confidence score and extract transactions, balances, and 25+ financial metrics via Gemini AI enrichment. 90% of documents resolve in under 200ms.
- Deployed serverlessly on AWS Lambda via Terraform (ECR, API Gateway, CloudWatch). 75-test pytest suite with synthetic PDF generation.

BubbleChat - Embeddable AI Chat Widget

github.com/JoshuaHungDinh/Bubble-Chat

- Zero-dependency embeddable widget (Web Components, Shadow DOM, 17KB) with real-time SSE streaming.
- Multi-tenant FastAPI backend with JWT auth, rate limiting, and a React 19 admin dashboard with live preview.

SKILLS

Languages:	TypeScript, JavaScript, Python, PHP, SQL
Frontend:	React 18/19, Next.js 15, Tailwind CSS, Framer Motion, Web Components
Backend:	Node.js, FastAPI, REST APIs, PostgreSQL, Supabase
Infra:	AWS (Lambda, API Gateway, ECR), Terraform, Docker, Vercel
Testing:	pytest, PHPUnit, Postman
